# **Bimloq**

The main aim of Business Models Optimization for Quality (BIMLOQ) is to build a declarative model sor business processes, including business rules specification, with an emphasis on analysis and optimization of those processes.

## **Description**

#### **Motivation**

- **Semantic:** lack of a common ontology, lack of unified semantics, difficult unambiguous logical representation.
- **Functional:** aims and tasks in the business logic layer cannot be mapped to logical quality assessment methods.
- **Technical:** technologies used in the visual design layer are incompatible with the declarative logical representation.

#### **Problem statement**

## **Expected benefits**

- Real-time quality assessment during development.
- Maintainability assurance.
- Formal analysis of business software quality.
- High adaptability in dynamic environments.

#### Intended results

- Conceptual: declarative model for logical business process representation and analysis.
- Practical:
  - new tools for analysis and optimisation of specification quality,
  - integration of visual BPMN tools and logical knowledge processing.
- **Evaluative:** modeling and analysis of real-life application use cases.
