GEIST Research Profile

Group for Engineering of Intelligent Systems Technologies (GEIST) was created in 2009 by Grzegorz J. Nalepa and Antoni Ligęza and a group of dynamic young researches. The research interests of the Group is located in the area of computer science and artificial intelligence. It is focused on the methods, and tools for developing and applying intelligent technologies and systems.

Areas

GEIST is mainly focused on the following *areas of development and applications* of intelligent technologies and systems:

1. **machine learning and data mining** including big data analysis and explainable artificial intelligence methods in practical applications
2. **knowledge engineering** including semantic information processing and explainability
3. **business intelligence** including business process management
4. **ambient intelligence** including context-aware systems
5. **affective computing** with focus on emotion detection and interpretation in mobile systems

Methods

We use and develop specific *methods and tools* such for:

- knowledge representation and reasoning
- knowledge engineering and management
- rule-based systems
- explainable artificial intelligence (XAI)
- business processes
- formal verification
- semantic annotations and

The expertise of the Group includes:

- design and implementation, as well as formal verification and analysis of knowledge-based systems, mainly rule-based,
- modelling and evaluation of business rules and processes, see the Bimloq project
- distributed and collaborative knowledge management with semantic wikis, see the Loki semantic wiki system

- ontologies
- visual design of knowledge bases
- semantic wikis for knowledge engineering
- machine learning techniques
- context-aware applications
- software engineering
- Semantic Knowledge Engineering methodology, including the eXtended Tabular Trees rule modeling formalism
- emotion detection and interpretation

Contacts

Finally the group is active in the area *international collaboration* for both research and teaching:

- scientific collaboration with Universities of [Wuerzburg](#), [Kassel](#), [Siegen](#), and [Almeria](#), [Murcia](#), [Halmstad](#), [Politecnica de Madrid](#)
- teaching collaboration in the scope of the Erasmus LPP
- participation of group members in the Organizing Committees international conferences and workshops, including
- [PRAXAI](#), [SEDAMI](#), [KESE](#), [RuleApps](#), and number of Program Committees see [here for more details](#).
- see also for the [AfCAI community](#) we created

We are looking for partners, and projects – [contact us!](#)
