# Software

This page summarizes information on the software tool developed by GEIST.

## Affective Computing tools

- [BandReader](#) is a software simplifying physiological data acquisition from wristbands as well as other measurement platforms such as Bitalino

## Knowledge base editors

- [HWE](#) is online web editor for creating XTT2 models, that are run by [HeaRTDroid](#) inference engine.
- [HQED](#) is an advanced visual editor for modularized rule bases developed with the XTT2 knowledge representation for rules. Originally developed within the HeKatE project. Extended during the BIMLOQ to include support for rules integrated with business processes. Enhanced wrt GUI within the Parnas project.
- [VARDA](#) is a tool for fast conceptual prototyping of rule bases ARD+ method
- [HJEd](#) is a visual prototyping of rule bases with the ARD+ method

## Reasoning engines

- [HeaRTDroid](#) is a rule-based inference engine both for Android mobile devices, and desktop solutions supported by visual web editor [HWE](#). It is distributed under the GNU General Public License
- [HeaRT](#) is a hybrid rule inference engine for modularized rule bases developed with the XTT2 knowledge representation for rules. It also supports practical rule verification. Originally developed within the HeKatE project. Later on extended towards reasoning with business processes as well as in integrated in a semantic wiki.
- [PelletHeart](#) a prototype inference engine linking the HeaRT rule engine with Pellet, the Description Logics reasoner.

## Knowledge base translators

- **HaThor** is rule base translator tool from the XTT2 format to RIF, OWL (partially) and UML

## Semantic wikis for collaborative knowledge engineering

- **Loki** is a novel semantic wiki platform offering strong reasoning capabilities of Prolog. It is a successor of the PIWiki engine. It was extended during the BIMLOQ project to support BPMN business processes via the BPwiki plugin.

## GEIST Seasons of Code

GEIST organizes two programs for students wanting to work together with us on software projects:

- **Spring of Code** organized every early spring and
- **Winter of Code** organized every late fall.
